

CASE STUDY: Improved Load Planning & Inventory Accuracy

- Sunland assumed the responsibility of load planning from WestRock (formerly Meadwestvaco Paper Division) which resulted in identifying old moving stock, increased inventory turns, and reduced container usage. Outbound trailer utilization improved by 22% and transportation costs were significantly reduced.
- After implementing a cycle count program it made a significant impact on the operation's year end physical inventory results to 99.97% accuracy.
- Sunland's inspection processes helped WestRock have information of ongoing problems involving inbound product damages. Our team collaborated with WestRock to identify some of the root causes of the problem and worked with their management in implementing a packaging solution that led to a significant reduction in damaged product.
